

Docker

Installation

<https://docs.docker.com/get-docker/>

Docker Documentation

See (Part 1 - Part 5) from here:

<https://docs.docker.com/get-started/>

Some Docker Commands(You need to add options and file/dir names)

- docker build(read Dockerfile and build image accordingly) / docker pull — image create/pull
- docker run — image to container
- docker image ls — show all images
- docker container ls/ docker ps/ docker ps -a — show containers(What's the difference?)
- docker commit — commit a container's change into a new image
- docker pull — download docker image from the internet
- Docker push — share a local docker image to a public/private registry

You can see other docker commands here:

<https://docs.docker.com/engine/reference/commandline/docker/>

Forcing docker image to use linux/amd64 platform on macOS

- docker build -t demo . --platform linux/amd64
